WorkTre Desktop App & WorkTre Web Application

Workforce operations: accurate time on the employee PC,
attendance, payroll, and HR in the browser.

September 2026 · Version 2.2.3 · worktre.com

1. How the two products fit together

WorkTre is a workforce operations platform. Employees clock time on the **Desktop App**. Managers run attendance, payroll, HR, and alerts in the **Web Application**. Both share the same employee account, company rules, and SOAP/web services.

	Desktop App	Web Application
Who uses it	Employees on a PC (Windows first)	Super Admin, Owner, HR, Finance, managers, employees
Primary job	Clock-in, shift timer, breaks, idle, optional screenshots	Attendance, payroll, leaves, HR, reports, alerts
Runs on	Installed Windows app (WebView2)	Browser at worktre.com
Produces	Login/logout, heartbeats, idle windows, breaks, screenshots	Policies, approvals, salaries, reports, dashboards

Typical day

- Employee installs WorkTre App, logs in with WorkTre credentials.
- App sends login + computer name + IP, then a heartbeat about every 5 minutes.
- Manager opens the web Dashboard and sees online / idle / stale, attendance gaps, and payroll readiness.
- Employee can open the full web app from the Desktop App (“Open in Browser”).

Figure 1. WorkTre web marketing site (worktre.com/welcome) — product positioning.

2. WorkTre Desktop Application

Product name on the device: **WorkTre App** (not “agent” or “monitor”). Current installer **2.2.3**, per-user install under %LOCALAPPDATA%\WorkTre. Screens below are captured from the real Desktop UI.

Figure 2. Desktop App login — email/password, Remember me, Forgot Password, version stamp.

2.1 Login and identity

- Email + password against WorkTre SOAP (worktre.com web services).
- Remember me — credentials stored encrypted locally in %APPDATA%\WorkTre.
- Forgot password opens the web reset flow.
- IP allow-list: unregistered IPs are blocked; employee can request access.
- Login payload includes computer name, app version, and IP.
- Crash login restores session after an unexpected close. Single-instance lock per PC.

Figure 3. Desktop home — live shift timer, shift window, login/break/logout timeline, break controls.

2.2 Shift, attendance, and breaks

- Live circular shift timer with hours remaining vs scheduled shift.
- Login time, total break time, and logout status on the home screen.
- Resume-from-server so a restart does not reset the day's clock.
- Open in Browser — SSO-style link into the web app.
- Start / end break from play / pause. Break types come from the company.
- Dedicated break timer while on break. Inactivity is its own break type.

Figure 4. Break picker — company break types, optional comment, start break.

Figure 5. Break Logs — time, type, duration, with pagination.

2.3 Idle, heartbeats, and screenshots

- Native Windows idle detection (GetLastInputInfo).
- Warning after inactivity (default 5 minutes), then auto-logout (default 10 minutes).
- Completed idle windows (start + end) are sent on the heartbeat.
- Heartbeat (~5 minutes) powers online / idle / stale on the web dashboard.
- Offline queue — heartbeats sync when the network returns.
- Screenshots only if the company enables them; all monitors; blur before upload (Off / Light / Medium / Strong).
- Employee acknowledges screenshot consent. App / URL tracking is not enabled.

Figure 6. Desktop Settings — app health, privacy notice, and what is tracked on this device.

Figure 7. Screenshot privacy — blur level (Medium recommended) before upload.

Figure 8. First-login trust notice — employee acknowledges monitoring and screenshot policy.

2.4 Windows shell, updates, and packaging

- Minimize to system tray (Restore / Settings / Quit) with native notifications.
- Always-on-top inactivity warnings and native confirmation dialogs.
- Auto-start at Windows logon (installer Run registry key).
- Start Menu + Desktop shortcuts; Add/Remove Programs uninstall.
- In-app auto-update (.exe download, UAC elevation if needed).
- TLS certificate verification on SOAP/API. Encrypted remember-me store.
- PyInstaller Windows .exe + Inno Setup per-user installer (no admin required).

In-app **Notifications** inbox and **Profile** screens are still placeholders (“Coming Soon”). The avatar still loads from the web app.

3. WorkTre Web Application

Browser product at **worktre.com**. Role-based menus (Interfaces + permissions). Employees, managers, HR, Finance, Owners, and Super Admin each see a different home.

Figure 9. Web application login — Remember me, password reset, register.

3.1 Role-scoped home dashboard

Role	What they see
Super Admin	Company picker; all companies they administer
Owner / HR / Finance	Own company KPIs; payroll/money panels only with View Salaries
Department managers	Their departments — capacity, exceptions, attrition
Employees	Self-serve: my status today, leave, why I'm flagged, WorkTre App health

Dashboard blocks (by role) include:

- Today's attendance summary and 7-day trend; recent absences and pending leave count.
- Payroll close-out / readiness (pay-period blockers, verify/lock progress).
- Money queue (salaries, loans, advances, bonuses) and HR request queue.
- Team trust — WorkTre App online / idle / stale from the last heartbeat.
- Capacity, attrition, and attendance alerts preview.
- Restaurant / hospitality extras (low-stock alerts) when that industry is set.

Figure 10. Web product features — attendance, payroll, HR, and additional systems.

3.2 Attendance, shifts, breaks, and leaves

- Real-time attendance by employee, department, company, and date range.
- Worked hours vs shift hours, late/absent flags, Excel-style export.
- Attendance Alerts inbox: short hours, no login, idle logout, missing punches — with “why?” explanations.
- Attendance correction requests, biometric import, office IP allow-list, geo-location, IP overrides.
- Shift definitions, bulk update, change approvals, schedules, and swaps.
- Company break types and break approval requests.
- Leave types, requests, pending/rejected, special leaves, encashment, carry-forward, holidays.

3.3 Payroll, HR, and operations

- Salaries: calculate, verify, lock by department/account; period close-out on the Dashboard.
- Tax slabs, bank sheets, provident fund, SESSI, EOBI, overtime, bonuses, advances, loans, insurance, incentives, fines, payslips.
- Multi-company setup, employee profiles/import, designations, reporting lines, roles and interface permissions.
- HR forms: joining, employment proof, probation-end, internship, transfer, requisitions, feedback.
- Company assets, retentions, expenses, stock orders.
- Restaurant / Hospitality Ops when the industry flag is set.

3.4 Screenshots, integrations, and security

- Screenshot gallery (only if the company enabled capture) plus owner/Super Admin privacy settings (consent, retention, who can view).
- Slack and Microsoft Teams webhooks for high-severity attendance alerts.
- Email notifications, Google Calendar connector, scheduled payroll/attendance crons.
- SOAP web services consumed by the Desktop App; auto-login from Desktop into the web session.
- Role-based Interfaces + named permissions (e.g. View Salaries, View Attendance Alerts).
- Office IP allow-list; Super Admin vs company-scoped data; lock screen; password reset.

Figure 11. Public pricing on worktre.com — Basic / Standard / Premium per user.

Desktop **does not** send app/URL tracking. A legacy Tracking endpoint exists in the web codebase; it is not used by the current Desktop App.

4. Shared platform capabilities

Company-wide rules are configured in the web app and enforced on the employee PC.

Capability	Configured in Web	Enforced in Desktop
Login / logout attendance	Dashboard, Attendance	Clock in/out
Shift window	Shifts	Shift timer
Break types	Breaks	Break picker
Idle warning / logout	Service settings	Idle monitor
Screenshots on/off	Employee / screenshot settings	Capture + blur + consent
Allowed office IPs	Office IPs	Login block + request access
Online / idle / stale	Dashboard trust panel	Heartbeat every ~5 min
App version	Version report	Auto-update

5. What is captured vs not captured

Captured	Default	Where it shows
Attendance login / logout	On	Desktop + Web Attendance
Shift timer & breaks	On	Desktop + Web
Idle / away time	On	Desktop + Web alerts
Activity heartbeat (~5 min)	On	Web "WorkTre App online"
Screenshots	Company-controlled	Web gallery if enabled

Captured	Default	Where it shows
App / URL tracking	Off in Desktop App	Not used by current client

Heartbeats may queue offline so hours are not silently lost.

6. Who should use which product

- **Employees** — **Desktop App** to clock a shift, take breaks, and stay visible as online for payroll.
- **Managers** — **Web Application** to approve leave, clear attendance exceptions, run payroll, or see team capacity.
- **HR / Finance** — **Web Application** for salaries, taxes, banks, loans, bonuses, and period close-out.
- **Super Admin** — **Web Application** for multi-company setup, roles, IPs, screenshot policy, and Slack/Teams integrations.

7. Packaging and support notes

Topic	Practice
Desktop install	Download installer → run (no admin) → log in → first heartbeat on dashboard within minutes
Desktop data on device	%APPDATA%\WorkTre (prefs, logs, encrypted remember-me)
Transport	TLS verification enabled for SOAP/API
Web	Role dashboards, payroll close-out, attendance alerts, integrations
Pilot checklist	5–10 PCs → log in → Settings matches policy → manager sees online in ~5 minutes → run alerts + one payroll close-out

8. One-line summary

WorkTre App records time for correct pay on the employee PC. WorkTre Web turns that time into attendance, alerts, payroll, and HR — with blur-by-default screenshots only if the company enables them, no app/URL tracking from the desktop client, and a dashboard status employees can see themselves.

Images in this PDF are screenshots of the live Desktop UI (served from the application assets) and the production web site at worktre.com. Dashboard sample name is for illustration.
